

Shanghai Silo Machinery Equipment Co.,Ltd.

Silica Sand Steel Silo

Shanghai Silo Machinery Equipment Co.,Ltd is one of the leading silica sand steel silo manufacturers and suppliers in China, welcome to buy customized bulk silica sand steel bin made in China from our factory.

The spiral steel silo characteristics lie in:

1 Good overall performance , long service life: spiral seaming edge five times the parent metal thickness, which greatly strengthens the silos` body

Shanghai Silo Machinery Equipment Co.,Ltd.

resistance to load capacity;its stability and strength service life are better than that of other steel silos.

2 Good air-tightness,extensive usage: this seaming by special equipment bending forming , sealing performance is especially good; can be used in granular, powder, grain storage ; avoid external humidity influence in inside materials, and at the same time can satisfy the insecticidal, fumigation etc process requirement, and can also be used to store liquid objects.

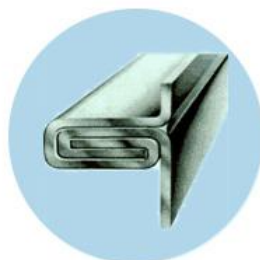

3 Short construction period, low cost: the silo body weight is equivalent to 1/6 of concrete silo with same volume , which greatly reduce the basic cost; at the same time extremely short construction period (1000 tons of silo, need only about five days time)

4 Small floor space, easy management:the spiral steel silo is better than that of other silos also lies in its height and diameter,which can be in great range choice and adaptation,e.g. granary spacing can be small to 50 cm.

Technical advantages of spiral steel silo:

Our company adopts advanced Germany silo construction technology,and building method is unique.While constructing, first feed 495 mm wide coil sheet by decoiling machine into bending machine bending, seaming, and then through the forming machine rolling into needed geometric shape, around the silo lateral forming a 30-40 mm wide, encircling spiral protruding strip on the structure playing the role of strengthening silo. For two different kinds of materials, silo construction equipment also can realize double bending processing.

The silo is site operation, silo top is ground installation, and no need of scaffolding and other auxiliary facilities. Silo construction equipment work at the speed of 3-5 m/min of forming and bending,so the construction period is very short. Silo construction equipment only need a truck can be delivered to site,so the transport costs is quite low. Silo is made of thin plate, with only the equivalent of the capacity of cement bin rebar weight, so the construction cost is rather low.
